```

## 1.1 Queries

1. What is the maximum number of goals recorded in a match? Output a single number.

```
[4]: %%sql sqlite
SELECT
    MAX(home_team_goal + away_team_goal) AS max_total_match_goals
FROM
    MATCH;
```

```
[4]: +-----+
| max_total_match_goals |
+-----+
|          12          |
+-----+
```

2. List each league name and its number of teams sorted from high to low.

```
[6]: %%sql sqlite
SELECT
    b.name,
    COUNT(*) AS count_teams
FROM
    (
        SELECT DISTINCT
            home_team_api_id,
            league_id
        FROM
            MATCH
    ) a
LEFT JOIN league AS b ON a.league_id = b.id
GROUP BY
```

```
league_id
ORDER BY
count_teams DESC;
```

```
[6]: +-----+-----+
|          name          | count_teams |
+-----+-----+
|    France Ligue 1      |          35 |
| England Premier League |          34 |
| Spain LIGA BBVA        |          33 |
|    Italy Serie A       |          32 |
| Germany 1. Bundesliga  |          30 |
| Portugal Liga ZON Sagres |          29 |
| Netherlands Eredivisie |          25 |
| Belgium Jupiler League |          24 |
|    Poland Ekstraklasa   |          22 |
| Scotland Premier League |          17 |
| Switzerland Super League |          15 |
+-----+-----+
```

- Who are the GoalKeepers (GK) that have played all the away games for their team? Output the `team_long_name` and `player_name` (assuming `match.away_player_1` is the goalkeeper column).

```
[7]: %%sql sqlite
SELECT
    team_long_name,
    player_name
FROM
    (
        SELECT
            away_team_api_id,
            COUNT(*) AS total_team_away_matches,
            away_player_1
        FROM
            MATCH
        GROUP BY
            away_team_api_id
    ) a
LEFT JOIN (
    SELECT
        away_player_1,
        COUNT(*) AS total_gk_matches
    FROM
        MATCH
    GROUP BY
        away_player_1
    ) b ON a.away_player_1 = b.away_player_1
```

```

LEFT JOIN player AS c ON b.away_player_1 = c.player_api_id
LEFT JOIN team AS d ON a.away_team_api_id = d.team_api_id
WHERE
total_team_away_matches = total_gk_matches;

```

```

[7]: +-----+-----+
|      team_long_name      |      player_name      |
+-----+-----+
|      Angers SCO          |      Ludovic Butelle   |
|      SV Darmstadt 98     |      Christian Mathenia |
|      SC Paderborn 07     |      Lukas Kruse       |
|      Norwich City       |      John Ruddy        |
|      CD Tenerife        |      Sergio Aragones    |
|      DSC Arminia Bielefeld |      Dennis Eilhoff     |
|      Hércules Club de Fútbol |      Juan Jesus Calatayud |
+-----+-----+

```

## 1.2 PART II - New Database Schema (PostgreSQL)

**0. Migrate the SQLite Database to PostgreSQL** Instead of writing tedious migration code ourselves, we will be using the `pgloader` CLI tool to get started quickly. The migration task is setup using a command-file. Lets see inside that file.

```
[10]: !cat ./command-file.txt
```

```

load database
  from '/home/jovyan/data/database.sqlite'
  into postgresql://db:db@postgres/db

with include drop, create tables, create indexes, reset sequences,

prefetch rows = 100, max parallel create index = 1

set work_mem to '16MB', maintenance_work_mem to '512 MB';

```

```
[12]: !pgloader ./command-file.txt
```

```

2025-08-07T16:37:55.020648Z LOG pgloader version "3.6.10~devel"

+-----+-----+-----+-----+-----+-----+-----+-----+							
-----+-----+							

**1. Functions, Stored Procedures, and Triggers** Provide the SQL instructions corresponding to each of the following tasks:

1. Create a new `match_player` table to store the data for the starting players (11) for each match (currently stored in the columns `match.home_player_DD` and `match.away_player_DD`). We are going to copy the data contained in the table `match` to `match_player` but we want to use a new column for the player position `position`.

```
[15]: %%sql psql
DROP TABLE IF EXISTS match_player;

CREATE TABLE
  match_player (
    id SERIAL,
    player_id BIGINT,
    team_id BIGINT,
    match_id BIGINT,
    league_id BIGINT,
    POSITION BIGINT,
    cond TEXT,
    PRIMARY KEY (id),
    FOREIGN KEY (player_id) REFERENCES player (player_api_id),
    FOREIGN KEY (match_id) REFERENCES MATCH (id),
    FOREIGN KEY (team_id) REFERENCES team (team_api_id),
    FOREIGN KEY (league_id) REFERENCES league (id)
  );
```

```
[15]: ++
||
++
++
```

2. Populate the new table `match_player` using the data contained in the table `match` using a function or stored procedure.

```
[16]: %%sql psql

DELETE FROM match_player;

CREATE OR REPLACE FUNCTION populate_match_player()
RETURNS void AS $$
DECLARE
  match_row RECORD;
  i INT;
  home_player_id INT;
  away_player_id INT;
BEGIN
  FOR match_row IN SELECT * FROM match LOOP
    FOR i IN 1..11 LOOP
      EXECUTE format(
        'SELECT %I FROM match WHERE id = %L',
        format('home_player_%s', i),
        match_row.id
      ) INTO home_player_id;

      IF home_player_id IS NOT NULL THEN
```

```

        INSERT INTO match_player (player_id, team_id, league_id,
↪match_id, position, cond)
        VALUES (home_player_id, match_row.home_team_api_id, match_row.
↪league_id, match_row.id, i, 'home');
    END IF;

    EXECUTE format(
        'SELECT %I FROM match WHERE id = %L',
        format('away_player_%s', i),
        match_row.id
    ) INTO away_player_id;

    IF away_player_id IS NOT NULL THEN
        INSERT INTO match_player (player_id, team_id, league_id,
↪match_id, position, cond)
        VALUES (away_player_id, match_row.away_team_api_id, match_row.
↪league_id, match_row.id, i, 'away');
    END IF;
END LOOP;
END LOOP;
END;
$$ LANGUAGE plpgsql;

```

```

[16]: ++
      ||
      ++
      ++

```

Here we execute our function as this is the way to do it in PostgreSQL

```

[17]: %%sql psql
      SELECT
      populate_match_player ();

```

```

[17]: +-----+
      | populate_match_player |
      +-----+
      |                         |
      +-----+

```

Here we show the table to review if it is right

```

[18]: %%sql psql
      SELECT
      *
      FROM
      match_player
      LIMIT

```

```
10;
```

```
[18]: +-----+-----+-----+-----+-----+-----+-----+
| id | player_id | team_id | match_id | league_id | position | cond |
+-----+-----+-----+-----+-----+-----+-----+
| 1 | 39890 | 9996 | 145 | 1 | 1 | home |
| 2 | 34480 | 8635 | 145 | 1 | 1 | away |
| 3 | 38388 | 8635 | 145 | 1 | 2 | away |
| 4 | 38788 | 9996 | 145 | 1 | 3 | home |
| 5 | 26458 | 8635 | 145 | 1 | 3 | away |
| 6 | 38312 | 9996 | 145 | 1 | 4 | home |
| 7 | 13423 | 8635 | 145 | 1 | 4 | away |
| 8 | 26235 | 9996 | 145 | 1 | 5 | home |
| 9 | 38389 | 8635 | 145 | 1 | 5 | away |
| 10 | 38798 | 8635 | 145 | 1 | 6 | away |
+-----+-----+-----+-----+-----+-----+-----+
```

**2. SQL Queries** Consider the new `match_player` table above and write SQL queries for each of the following information needs.

1. List all the teams that 'Cristiano Ronaldo' has played for (regardless of starting position)

```
[19]: %%sql psql
SELECT DISTINCT
    c.team_long_name
FROM
    match_player a
    LEFT JOIN player b ON a.player_id = b.player_api_id
    LEFT JOIN team c ON a.team_id = c.team_api_id
WHERE
    b.player_name = 'Cristiano Ronaldo';
```

```
[19]: +-----+
| team_long_name |
+-----+
| Manchester United |
| Real Madrid CF |
+-----+
```

2. Who are the players that have played all the away games for their team? Output the `team_long_name` and `player_name`.

```
[20]: %%sql psql
SELECT
    c.team_long_name,
    d.player_name
FROM
    (
```

```

SELECT
    player_id,
    team_id,
    COUNT(*) AS count_ma
FROM
    match_player
WHERE
    cond = 'away'
GROUP BY
    player_id,
    team_id
) a
LEFT JOIN (
    SELECT
        away_team_api_id,
        COUNT(*) AS count_matches_away
    FROM
        MATCH
    GROUP BY
        away_team_api_id
) b ON a.team_id = b.away_team_api_id
LEFT JOIN team c ON a.team_id = c.team_api_id
LEFT JOIN player d ON a.player_id = d.player_api_id
WHERE
    a.count_ma = b.count_matches_away;

```

[20]:

team_long_name	player_name
CD Tenerife	Sergio Aragones
DSC Arminia Bielefeld	Dennis Eilhoff
SV Darmstadt 98	Christian Mathenia
Bournemouth	Andrew Surman
Falkirk	Darren Barr
KAS Eupen	Ervin Zukanovic
Karlsruher SC	Sebastian Freis
RC Recreativo	Asier Riesgo
FC Energie Cottbus	Gerhard Tremmel
FC Ingolstadt 04	Marvin Matip
FC St. Pauli	Matthias Lehmann
SV Darmstadt 98	Luca Caldirola
Watford	Heurelho Gomes
Birmingham City	Roger Johnson
SC Paderborn 07	Lukas Kruse
Angers SCO	Romain Thomas
Cardiff City	Steven Caulker
Feirense	Fernando Varela

	Uniao da Madeira		Diego Galo	
	Fortuna Düsseldorf		Fabian Giefer	
	Reading		Jobi McAnuff	
	Dijon FCO		Baptiste Reynet	
	Bournemouth		Simon Francis	
+-----+-----+				

3. What is the match with the highest number of goals? Output `team_long_name` for both home and away teams, and the total number of goals for each team.

```
[21]: %%sql psql
SELECT
  c.team_long_name AS away_team,
  away_team_goal,
  d.team_long_name AS home_team,
  home_team_goal,
  total_goals
FROM
  (
    SELECT
      id,
      away_team_api_id,
      home_team_api_id,
      home_team_goal,
      away_team_goal,
      (home_team_goal + away_team_goal) AS total_goals
    FROM
      MATCH
  ) a
INNER JOIN (
  SELECT
    MAX(home_team_goal + away_team_goal) AS most_goals_match
  FROM
    MATCH
) b ON total_goals = most_goals_match
LEFT JOIN team c ON c.team_api_id = a.away_team_api_id
LEFT JOIN team d ON d.team_api_id = a.home_team_api_id;
```

```
[21]: +-----+-----+-----+-----+
--+
| away_team | away_team_goal | home_team | home_team_goal |
total_goals |
+-----+-----+-----+-----+
--+
| Hibernian | 6 | Motherwell | 6 | 12
|
| Rayo Vallecano | 2 | Real Madrid CF | 10 | 12
|
```

+-----+-----+-----+-----+-----+  
--+
